Notes on Using the Zipped Faces2 Project

The zipped project folder Faces2.zip contains the entire project folder for Project Faces2, including the source codes for AbstractFace, BoxFace, EllipseFace.

If you want to play with code inside, you don't have to create new projects, new classes and paste the source code.

Follow these steps, you will be able to place the existing project in your own workspace folder in NetBean IDE.

1. Unzip the file Faces2.zip to any location.
2. Copy the unzipped folder Faces2 to your NetBean IDE workspace folder, which is the folder that contains all your Java projects.
3. Click File->Open Project…, then a Pop up window appeared. Navigate to your workspace folder where Faces2 project folder is located. Click Open Project.
